

When we first go to the Obfuscated Password Checker question, we get a src.zip file. After extracting it we get two files, index.html and bundle.js (see bottom of report). Opening up index.html and typing in some random password, shows the following:

# Obfuscated Password Checker

nope...

## The Debugger (optional):

So the first thing I always do when dealing with web pages is open up the developer tools (Ctrl-Shift-i). After doing so I notice that if I go to the debugger, it keeps saying debugging. That means somewhere debugger is called. If you click continue, it nonstops says debugging, so we cannot get out of the loop.

After clicking pretty print inside the developer tools, it seems like it was coming from line 329. So I try going to js beautify, and beautifying the js file. However, I would get an overflow and nothing worked. Even simply replacing a ; with ;\n seems to cause an overflow. Therefore, no deobfuscators are going to work here...

I decide just to copy paste the prettified code into sublime, and statically analyze it. The first thing I do is try to disable the debugger so I can create break points where I think I will need them. I go to line 329, and see: `[_0x991f('0x3c', '\x4c\x74\x26\x35')](\x0x991f('0x3d', '\x65\x51\x71\x26'))()`. So I go to console inside the developer tools and paste `_0x991f('0x3c', '\x4c\x74\x26\x35')` in. I get "constructor". Then I paste in `_0x991f('0x3d', '\x65\x51\x71\x26')` and I get "debugger". So this seems to be calling the debugger.

I want to see if this whole function (`_0x2b0ce8`, where line 329 is a part of) is only used to stop people from using the debugger. So I check the following else statement the same way and

also get “constructor” and “debugger”. My guess was right. I notice this function is only called in one place, the very end. So I comment it out in bundle.js.

```
try{ _0x298f21(0x0);}catch(_0x1007bf){}}; // _0x2b0ce8();
```

Now the debugger works. I try setting some break points but I never hit any of them (I must have put them in opaque functions). So now I rethink my strategy.

### Static analysis:

A most basic password checker is an if else; if (user\_inputted\_password == password), else. And we know there is an input field for the password, so somewhere the javascript has to look at that input field. So this function catches my eye since it has document 3 times, and an if else.

```
function(_0x5e7bda, _0x24edfb) {
  var _0x256968 = _0x991f('0x24', '\x31\x5a\x35\x49');
  window[_0x991f('0x25', '\x66\x26\x74\x4a')](_0x991f('0x26', '\x34\x25\x6e\x71'), function() {
    var _0x4202b3 = document[_0x991f('0x27', '\x69\x24\x4d\x51')](_0x991f('0x28', '\x39\x30\x36\x31'));
    var _0x5726ad = document[_0x991f('0x29', '\x65\x61\x23\x47')](_0x991f('0x2a', '\x32\x4d\x29\x40'));
    var _0x5b2986 = document[_0x991f('0x2b', '\x53\x62\x55\x38')](_0x991f('0x2c', '\x65\x61\x23\x47'));
    _0x5726ad[_0x991f('0x2d', '\x48\x40\x5b\x68')](_0x991f('0x2e', '\x56\x70\x44\x24'), ()=>{
      var _0x5d7c01 = _0x4202b3[_0x991f('0x2f', '\x5d\x21\x57\x37')];
      _0x5b2986[_0x991f('0x30', '\x54\x5a\x30\x6f')](_0x991f('0x31', '\x77\x43\x31\x32')) = _0x991f('0x32', '\x45\x26\x77\x79');
      if (_0x5d7c01 === _0x256968) {
        _0x5b2986[_0x991f('0x33', '\x53\x62\x55\x38')] = _0x991f('0x34', '\x67\x4c\x31\x55');
        _0x5b2986[_0x991f('0x35', '\x48\x40\x5b\x68')] = _0x991f('0x36', '\x6e\x68\x76\x7a') + _0x256968;
      } else {
        _0x5b2986[_0x991f('0x37', '\x63\x4f\x32\x2a')] = _0x991f('0x38', '\x56\x70\x44\x24');
        _0x5b2986[_0x991f('0x39', '\x59\x5d\x55\x39')] = _0x991f('0x3a', '\x69\x24\x4d\x51');
      }
    });
  }, ![]);
}, ![]);
```

I start by analyzing the if statement, what is \_0x5d7c01 ?, Well it's \_0x4202b3[\_0x991f('0x2f', '\x5d\x21\x57\x37')]; , and \_0x4202b3 is: document[\_0x991f('0x27', '\x69\x24\x4d\x51')](\_0x991f('0x28', '\x39\x30\x36\x31'));

So I do the following in the console: var \_0x4202b3 = document[\_0x991f('0x27', '\x69\x24\x4d\x51')](\_0x991f('0x28', '\x39\x30\x36\x31')); and notice it is the password input field.

Then I evaluate \_0x4202b3[\_0x991f('0x2f', '\x5d\x21\x57\x37')] in the console, and it gives me 'qwd' the password I typed in! So now we know that if statement (\_0x5dc01===\_0x257968) is checking my password to something else! Probably the correct password.

So what is 0x256968? It is \_0x991f('0x24', '\x31\x5a\x35\x49') , I put that in console and get "HarekazeCTF{j4v4scr1pt-0bfusc4t0r\_1s\_tsur41}" Well that's looks like the flag, I put it into the password field, and we solved it.

# Obfuscated Password Checker

congratz! the flag is: HarekazeCTF{j4v4scr1pt-0bfusc4t0r\_1s\_tsur41}

Lessons learned from this ctf: Do not hide sensitive information inside the client side code, even if it is heavily obfuscated!

Here is the original code:
